

SYSTEM AND METHOD FOR ROUTING
CALLS USING DIALING PARTITIONS

ABSTRACT OF THE DISCLOSURE

5 A method of routing calls using dialing partitions
includes receiving a call request at a first call manager
from a first device coupled to a packet-based network. The
call request includes a telephone number that is associated
with a second device coupled to the packet-based network.
The method also includes accessing a dialing partition
table based on a partition search space associated with the
first device. The method further includes determining a
10 routing target that is associated with one or more
telephone numbers in the dialing partition table that match
the telephone number in the call request. In addition, the
method also includes communicating the call request to the
routing target.
